

Connectivity

Fibre to the Premises (FTTP)

The future of fast, reliable broadband is here

The race to ultrafast, full fibre broadband is underway with FTTP providers working hard to expand the UK coverage network.

The current Openreach coverage for FTTP is approximately 4.7 million premises with a further 2.4 million expected by the end of 2021. Are you ready to transition to the Single Order, All-IP world with the best of breed in full fibre connectivity?

FTTP is a full fibre solution which offers download speeds of up to 1Gbps, making it the fastest broadband product available to the market. Enabling users to perform multiple online activities, all at once without experiencing slowdowns, FTTP is the most reliable broadband technology.

Unlike copper-based technology, FTTP does not inherit signal loss due to distance or any environmental changes, such as degradation and noise interference, which can impact the performance of the broadband service.

Full fibre
cable from the
exchange to the
premises

Perfect solution
for home
working, offering
low latency,
meaning no more
slowdowns

Easy to overlay
additional IP
services such
as VoIP

Future-proof
broadband
preparing you
for the switch off
of the traditional
telephony
network

Download
speeds of up
to 1Gbps
